## South Korean Education Minister Resigns After Exam Chaos

As of Sunday November 22, 21:08 Texas time, South Korea's Education Minister, Choi Kyu-jin, resigned after a 72-hour period of significant turmoil surrounding the country's annual college entrance exam. The resignation comes after the government implemented sudden, last-minute changes to exam rules banning even basic artificial intelligence and smartwatches to cheat. These new security measures included telling students to bring analog watches and banning any wearable or mobile alerts during the test to identify unreturned phones. While the government argued the rules were necessary for cheating, the suddenness of these changes caused widespread anxiety and confusion among students and parents. The chaos peaked on Thursday, reacting to high-profile scandals where candidates used hidden earpieces or AI to achieve near-perfect scores. On the other side,

# South Korean Education Minister Resigns After Exam Chaos

By All Angles · November 22, 2026, 11:00 AM CT · **confirmed**

As of Sunday November 22, 21:08 Texas time, South Korea's Education Minister, Choi Kyo-jin, has stepped down following a period of significant turmoil surrounding the country's annual college entrance exam. The resignation comes after the government implemented sudden, last-minute rules designed to prevent students from using artificial intelligence and miniature cameras to cheat. These new security measures included telling students to cover clothing buttons with stickers and issuing emergency mobile alerts during the test to identify unreturned phones.

While the government aimed to combat a rise in high-tech cheating, the suddenness of these changes caused widespread anxiety and confusion for both students and teachers. On one side, officials were reacting to high-profile scandals where candidates used hidden cameras and AI to achieve near-perfect scores. On the other side, critics argue the abrupt changes placed an unfair burden on test-takers during one of the most important moments of their lives.

The President has accepted the resignation and is moving to appoint a successor.

# Russian Drone Strike Hits Residential Building Near Kyiv

By All Angles · November 22, 2026, 11:00 AM CT · **confirmed**

A Russian drone strike on a five-story apartment building in the village of Dymer, just north of Kyiv, has caused significant destruction and loss of life. Rescuers have been working through the rubble to find survivors, and as of Sunday, November 22, 21:08 Texas time, the death toll has risen to nine people, including a child. While early reports cited only a few fatalities, the numbers increased as workers recovered more bodies from the site.

At least nine residents were successfully evacuated, but many others were left trapped under the debris. This latest strike is part of a broader pattern of overnight aerial barrages hitting the Kyiv region, including attacks on a store in Vyshneve that killed one person and injured others. For the people living in these areas, the constant threat of drone and missile strikes makes daily life incredibly precarious, especially as they face a difficult winter ahead with growing power outages and economic strain.

While officials on the ground focus on the immediate rescue operations, the scale of these strikes highlights the ongoing impact of the conflict on civilian residential life.

# Mysterious Black Holes and Rapid Growth in the Early Universe

By All Angles · November 22, 2026, 11:00 AM CT · **confirmed**

Astronomers are uncovering clues about the mysterious origins of black holes that challenge our understanding of stellar death. New research suggests that some massive stars might bypass spectacular supernova explosions entirely, collapsing quietly into black holes instead. This process could explain a large population of black holes seen in the universe.

Meanwhile, observations of a galaxy from 12 billion years ago show a black hole that appears to have grown much faster than the stars in its host galaxy. While scientists are seeing patterns that match theoretical predictions, some researchers caution that these massive early black holes might be the largest of their kind in the sample, meaning we still need to find smaller, more typical examples to confirm how they all grow. As of Sunday November 22, 21:08 Texas time, these findings offer a new way to look at the history of the cosmos and how matter behaves under extreme gravity.

# Iranian Strikes Wound Two in Bahrain Following Military Escalation

By All Angles · November 22, 2026, 11:00 AM CT · **confirmed**

As of Sunday, November 22, 21:08 Texas time, two people were wounded in Bahrain following an Iranian strike on a civilian industrial site near Sitra Island. The victims include a Bahraini national with a disability and a Pakistani resident. While Bahraini authorities described the event as a criminal attack on a civilian area, the Iranian Revolutionary Guard Corps stated the strike was a response to US military presence, claiming they successfully targeted US Patriot radar systems at military bases in Al-Riffa and Awali, as well as an American drone over the Strait of Hormuz.

Additionally, the Iranian Navy reported that two supertankers caught fire after hitting naval mines in a restricted area east of the Strait of Hormuz, alleging the vessels had their navigation systems turned off. Saudi Arabia has condemned these actions as criminal attacks. These developments come as maritime incidents in the region appear to be rising, with reports indicating a significant increase in naval occurrences this year.

# Escalating Strikes Target Energy Infrastructure Across Ukraine and Libya

By All Angles · November 22, 2026, 11:00 AM CT · **confirmed**

Military strikes against energy and maritime infrastructure have expanded in scope, reaching as far as the Libyan coast. On Sunday, November 22, 21:08 Texas time, reports emerged of a Russian warship capsizing in Benghazi, Libya, following what is suspected to be a Ukrainian drone boat attack. Meanwhile, in Ukraine, Russian drone and missile strikes hit residential buildings and power facilities, causing significant damage.

In the Kyiv region, reports indicate at least 12 people have been killed after a building collapsed in Dymer. Strikes also hit the Dnipro and Zaporizhzhia regions, causing outages and injuring several people. In response, Ukraine's defense forces have targeted Russian oil infrastructure and logistics.

The humanitarian impact is mounting; according to UN data, civilian casualties rose 40 percent in the period leading up to mid-2026. With over 500 attacks on energy infrastructure documented, experts warn that full energy restoration in Ukraine may not be possible before next winter, leaving millions facing potential shortages of heat and electricity.

# U.S. Power Advantage Over China Shrinks Amid Middle East Conflict

By All Angles · November 22, 2026, 11:00 AM CT · **confirmed**

The gap between American and Chinese influence in Asia is narrowing to its lowest level in years. According to reports as of Monday November 23, 01:50 Texas time, the United States' comprehensive power score in the region has dropped to 78.9. While the U.S. remains the most powerful nation in Asia, experts say its military lead has reached a record low because of depleted weapons stockpiles and the diversion of troops to fight in the Middle East.

As Washington focuses on the war with Iran, China has been able to strengthen its own economic and diplomatic ties in the region. The situation is further complicated by domestic tensions in the U.S., where lawmakers are split over whether to defund the Iran war or risk a government shutdown. Meanwhile, in the Middle East, Iran is facing severe economic pressure and domestic energy shortages, yet it is also showcasing new missile capabilities.

While some view the U.S. military's position as being under threat, others note that the decline is driven by these recent strategic shifts rather than a sudden surge in Chinese strength. On the economic front, U.S. energy exports have reached record highs as global trade flows shift due to the ongoing conflict.

# Missile Intercepted Over Saudi Arabia As Tensions Rise

By All Angles · November 22, 2026, 11:00 AM CT · **confirmed**

Military officials in Saudi Arabia reported that air defenses intercepted and destroyed a Houthi ballistic missile launched toward the kingdom’s western Red Sea coast on Sunday, November 22, 2026. This area contains several major energy facilities, including the Yanbu crude oil export terminal and the Jazan refinery. The Houthis have intensified attacks on Saudi infrastructure recently, including previous strikes on airports, military sites, and office towers in Riyadh.

The Houthis say these operations are part of an ongoing conflict, while Saudi authorities describe the group’s actions as terrorist attacks. Meanwhile, in North Africa, officials in eastern Libya are investigating a suspected drone strike that caused an explosion and fire on a Russian Navy corvette, the Merkury, at a naval base in Benghazi. While no one has claimed responsibility for the Libyan incident, some reports suggest the use of Ukrainian sea drones.

These events highlight a volatile period of escalation across the region, affecting both energy hubs and international naval presence.

# Global Leaders React To Trump Calling Putin A Friend

By All Angles · November 22, 2026, 11:00 AM CT · **confirmed**

As of Sunday November 22, 21:08 Texas time, a wave of international condemnation has emerged following comments made by U.S. President Donald Trump regarding Russian President Vladimir Putin. During a recent meeting at the APEC summit in China, President Trump referred to Putin as “my friend,” a sentiment he shared on social media alongside a photograph of the two leaders shaking hands. While President Trump argued that having a relationship with a leader who possesses thousands of nuclear weapons is preferable to having an enemy, the rhetoric has sparked a sharp divide.

U.S. intelligence chief Jay Clayton clarified that while the term might be appropriate for personal discussions between heads of state, Putin is certainly not a friend to the United States in the context of the war in Ukraine. This sentiment was echoed by several international leaders, including the New Zealand Prime Minister who called Putin a killer, and British officials who described the Russian leader as a butcher. European allies, including Poland, have also distanced themselves from the characterization, maintaining that Putin is not a friend to their nations.

Meanwhile, domestic voices in the U.S. are divided; some former diplomats have called the language appalling, while some Republican senators have argued that the current approach is not putting enough pressure on Russia to end the conflict. At the center of the tension is the ongoing war in Ukraine, where Russia continues to hold roughly a fifth of the country’s territory despite claims from the Kremlin that it seeks a diplomatic resolution.

## Drone Strikes Hit Residential Areas and UN Building in Sudan

By All Angles · November 22, 2026, 11:00 AM CT · **confirmed**

Drone strikes hit residential neighborhoods in Khartoum, Omdurman, and Jebel Aulia early on Sunday, causing significant damage and loss of life. According to reports as of Sunday November 22, 21:08 Texas time, it is not confirmed exactly how many people were killed, but at least four to five deaths have been reported, including children, along with approximately nine to ten injuries. The strikes also damaged a United Nations building, an event the UN described as an unacceptable risk to its humanitarian staff.

Sources within the Sudanese army suggest the drones may have been launched from Ethiopia. In response to the strikes, Saudi Arabia has called for the protection of civilians and international organizations, urging respect for international humanitarian law. While various reports detail the devastation in Sudan, it is important to note that separate reports from Russia describe a different drone attack in Gorlovka, where a kindergarten and several vehicles were damaged.

# UN Secretary-General Expresses Deep Disappointment After Climate Summit Fails To Reach Agreement

By All Angles · November 22, 2026, 11:00 AM CT · **confirmed**

The COP31 climate summit in Antalya, Turkey, has concluded without a consensus, marking a major setback for international climate negotiations. After more than 44 hours of extensions, the meeting ended following the rejection of a draft agreement by several parties, including the European Union and Panama, because the text did not explicitly include a transition away from fossil fuels. The UN Secretary-General expressed profound disappointment over the lack of results, noting that while political negotiations have stalled, scientific realities like record-breaking temperatures and intensifying extreme weather continue.

Leaders from the summit emphasized that the world must do much more to address the crisis, specifically calling for developed nations to triple climate adaptation finance and meet their funding commitments for the most vulnerable countries. As of Monday, November 23, 01:50 Texas time, the outcome of these failed negotiations remains a significant point of concern for the international community.

# COP31 Climate Summit Ends Without Agreement

By All Angles · November 22, 2026, 11:00 AM CT · **confirmed**

The 31st United Nations Climate Change Conference in Antália, Turkey, has ended without reaching a final consensus, marking the first such impasse since 2009.

# Quantum Computing Hits New Milestones In Lab Tests And Energy Research

By All Angles · November 22, 2026, 11:00 AM CT · **confirmed**

In a trial of a specialized game involving four qubits, the quantum chip won over 98 percent of the time, far exceeding the 88.9 percent limit set by classical computing strategies. As this technology matures, it is already being applied to the energy sector. Companies are currently testing quantum software to stabilize power grids, develop more efficient solar cells, and find better ways to produce hydrogen fuel.

While some experts note that widespread commercial breakthroughs may still be years or decades away, the current focus is shifting toward using these advanced calculations to reduce energy costs and improve renewable resources.

# German Army Tests Kamikaze Drones And AI In Lithuania

By All Angles · November 22, 2026, 11:00 AM CT · **confirmed**

The German army has begun testing kamikaze drones and artificial intelligence targeting tools as part of its largest military drills in Lithuania to date. These exercises, known as Freedom Shield, involve military personnel from several nations, including Ukraine, the United States, the United Kingdom, Germany, and Latvia. As of Monday November 23, 01:50 Texas time, these specific details regarding the training movements have not been confirmed.

# Bitcoin Reclaims 60,000 Dollar Mark Following Market Volatility

By All Angles · November 22, 2026, 11:00 AM CT · **confirmed**

Bitcoin has made a sudden climb back above the 60,000 dollar mark after a recent plunge to roughly 55,000 dollars. This recovery comes following a period of intense volatility, including a strange incident where the price appeared to drop to 17,000 dollars on a specific trading platform. However, experts clarify that this was a localized flash crash caused by a liquidity vacuum in a Canadian-dollar trading pair rather than a total market collapse.

As of Monday, November 23, 01:50 Texas time, Bitcoin is trading around 60,000 to 61,000 dollars. Analysts are currently divided on what this means for the future. Some believe this bounce is part of a predictable cycle that follows historical patterns seen in previous years.

Meanwhile, developers have also been working to patch a vulnerability in the Bitcoin software that was identified through the use of artificial intelligence.

# BepiColombo Begins Its Journey Around Mercury

By All Angles · November 22, 2026, 11:00 AM CT · **confirmed**

After an eight-year journey, the BepiColombo spacecraft has successfully begun its orbit of Mercury, according to reports as of Monday November 23, 01:50 Texas time. This international partnership between the European and Japanese space agencies features a unique design with two separate orbiters traveling together. One will study the planet's surface and interior, while the other focuses on the magnetic field.

These two orbiters are expected to separate in December 2026 to begin specific scientific investigations in April 2027.

## Massive Data Breach Hits South Korean State Power Utility

By All Angles · November 22, 2026, 11:00 AM CT · **confirmed**

A massive data breach has struck the state-run Korea Electric Power Corp., leaving the sensitive information of approximately 1.52 million users exposed. The leak affected both the company's customer service platform and its electronic procurement system. As of Sunday, November 22, 21:08 Texas time, details suggest the compromised data includes names, resident registration numbers, bank account details, and credit card information for customers, alongside contact details for corporate representatives and employees.

This follows a separate breach involving over 35,000 people reported just last month. In response, the utility company has blocked external access to the affected systems and launched an investigation alongside government agencies and outside experts. While the company's leadership has apologized and promised to overhaul security systems to restore public confidence, the breach highlights a troubling trend of recent data leaks affecting various public and financial institutions.

# Scientists Discover Hidden Eye Disease That Silently Steals Night Vision

By All Angles · November 22, 2026, 11:00 AM CT · **confirmed**

Researchers have identified a new genetic eye disease that slowly erodes night vision and peripheral sight while leaving central vision intact for many years. This condition, which researchers are calling EFEMP1-associated late-onset retinal degeneration, is linked to a specific genetic variant that causes material to build up between cells in the eye. Because it can be hard to notice the changes as they happen, experts say difficulty adjusting to the dark might serve as a crucial early warning sign.

For families living with this genetic trait, this discovery is significant because it highlights a different way vision can fail compared to previously known disorders, offering a path toward earlier detection before damage becomes permanent. As of Sunday November 22, 21:08 Texas time, this discovery is confirmed.
